JARVIS Setup Guide

For Mac (macOS 14 or newer, Apple silicon: M1 or later) · Beta 0.1.0 · by h4harshill

JARVIS is a voice assistant for your computer. You talk to it in English, Hindi or Hinglish, and it can open apps, play music, read and write email, add calendar events, send WhatsApp messages, place calls through your iPhone and help with what's on your screen. It always asks before it sends, changes or deletes anything.

Setup takes about 10 minutes. You need: a Mac with an M1 chip or newer, a microphone (the Mac's own is fine), an internet connection and a Google account.

1. Unzip and install

1. Double-click **JARVIS-0.1.0-Mac.zip** in your Downloads folder. A folder with **JARVIS** and this guide appears.
2. Drag **JARVIS** into your **Applications** folder.

2. Open it the first time (once)

1. Open **Applications** and double-click **JARVIS**. macOS says Apple could not verify it. Click **Done** (not “Move to Bin”).
2. Open **System Settings** → **Privacy & Security** and scroll down.
3. Next to “JARVIS was blocked…”, click **Open Anyway**, enter your Mac password, then click **Open**. From now on JARVIS opens normally.

Why this step? This beta isn't notarized by Apple yet (that needs a paid Apple Developer ID, planned before the public launch). Only download JARVIS from the official page: **h4harshill.github.io/jarvis**.

3. First start

1. **Beta terms:** read them and click **I agree**.
2. **Gemini API key** (free; this is JARVIS's brain and voice):
    a. Click the link JARVIS shows, or open **aistudio.google.com/apikey**.
    b. Sign in with your Google account and click **Create API key**.
    c. Copy the key and paste it into JARVIS. It's stored in your Mac's keychain, never in a file.
3. **Mac permissions** (JARVIS shows a button for each):
    - **Microphone** (required): so you can talk to it.
    - **Accessibility** (optional): to click and type in other apps, control music and send WhatsApp messages.
    - **Screen Recording** (optional): to look at your screen when you ask. After allowing it, quit and reopen JARVIS.
4. When macOS asks “JARVIS wants to use … in your keychain”, click

Always Allow.

4. Connect Google (optional, recommended)

For Gmail, Calendar, Contacts and YouTube music: open **Connections** → **Sign in with Google**. Your browser opens.

1. Pick your Google account.
2. Google shows *"Google hasn't verified this app"* (normal for this beta). Click **Advanced** → **Go to JARVIS (unsafe)**.
3. Tick the permissions you want and click **Continue**. When the page says you can close it, go back to JARVIS.

You can add up to 5 Google accounts and choose which one each service uses. Other email (e.g. a Hostinger or Zoho address) can be added under Connections → Email.

5. Try it

Click the mic button in JARVIS and say:

"Jarvis, Safari kholo"	opens an app
"Volume 30 kar do"	changes the volume
"Kesariya bajao"	plays a song
"Mere latest emails padho"	reads your Gmail
"Kal 5 baje meeting add karo"	adds a calendar event
"Mummy ko WhatsApp karo: main 10 minute mein aa raha hoon"	sends a WhatsApp message (after you approve)
"Mummy ko call karo"	calls through your iPhone (after you approve)
"Mera screen dekho, ye error kya hai?"	looks at your screen once

Approvals: before JARVIS sends a message, places a call, adds an event or changes something, it shows an approval card. Click **Confirm** or say **"yes"**. JARVIS can never approve its own actions.

6. WhatsApp and calls (optional)

- **WhatsApp:** install WhatsApp from the Mac App Store, log in once, and allow Accessibility for JARVIS. JARVIS opens the chat with your message typed, checks it, and sends only after you approve. It never guesses a contact: if two people match a name, it asks which one.
- **Phone calls:** your iPhone and Mac must use the same Apple Account. On the iPhone turn on **Calls on Other Devices** for this Mac (Settings → Phone, or Settings → Apps → Phone), and on the Mac open FaceTime → Settings and tick **Calls from iPhone**.

7. Everyday tips

- Settings → General: **Keep running in the menu bar** (closing the window keeps JARVIS in the menu bar; quit from its icon or with ⌘Q) and **Open at login**.
- Something wrong or an idea? Say **“Jarvis, send feedback …”**, or use Diagnostics → **Report a problem**.

8. Privacy and safety

- JARVIS runs on your Mac. Your history, memory and settings stay on this computer.
- Your voice goes to Google's Gemini to understand and answer you. Keys and Google sign-ins are kept in your Mac's keychain.
- JARVIS looks at your screen only when you ask, and shows a notice every time.
- Full privacy policy: **h4harshill.github.io/jarvis/privacy.html**

9. Uninstall

Quit JARVIS, then drag **JARVIS** from Applications to the Bin.
